Descriptors

Local features: main components

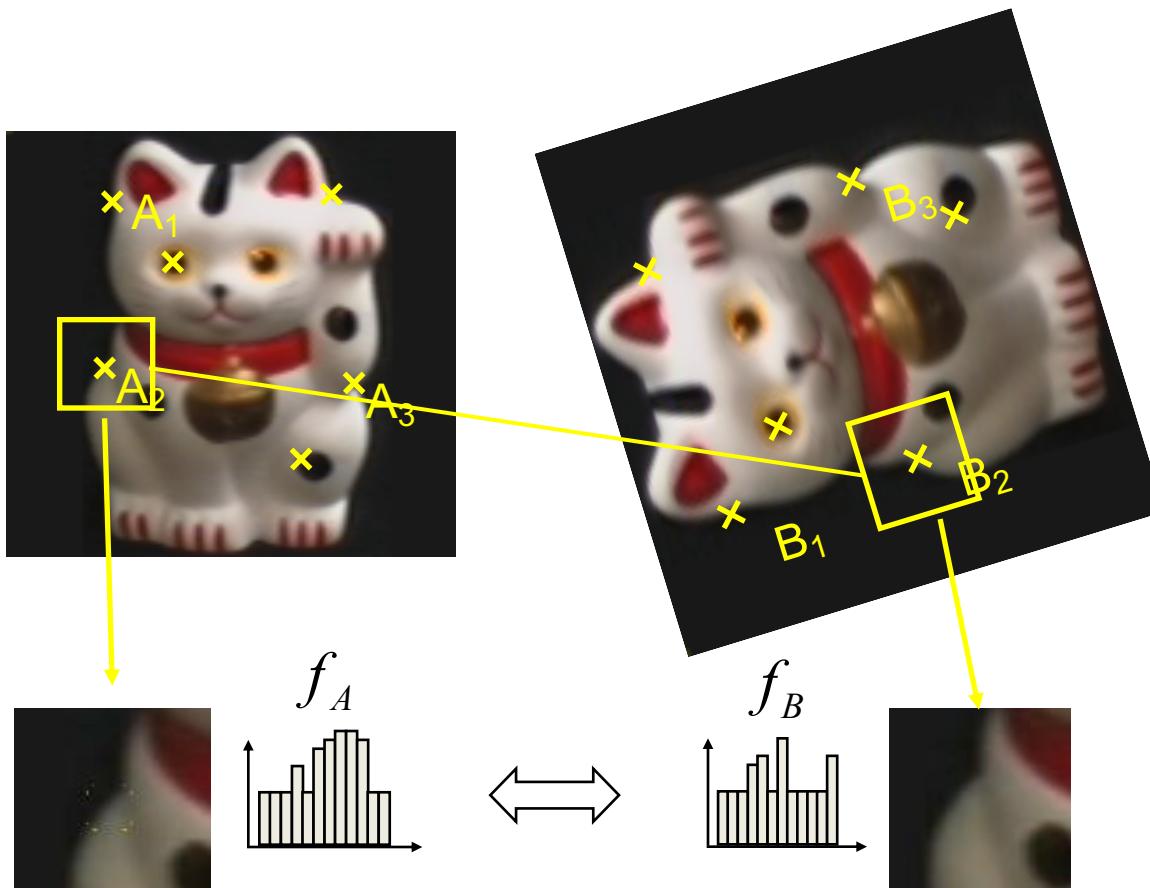

1) **Detection:** Identify the interest points

2) **Description:** Extract vector feature descriptor surrounding each interest point.

3) **Matching:** Determine correspondence between descriptors in two views

Overview of Keypoint Matching

$$d(f_A, f_B) < T$$

- 1. Find a set of distinctive keypoints**
- 2. Define a region around each keypoint**
- 3. Compute a local descriptor from the normalized region**
- 4. Match local descriptors**

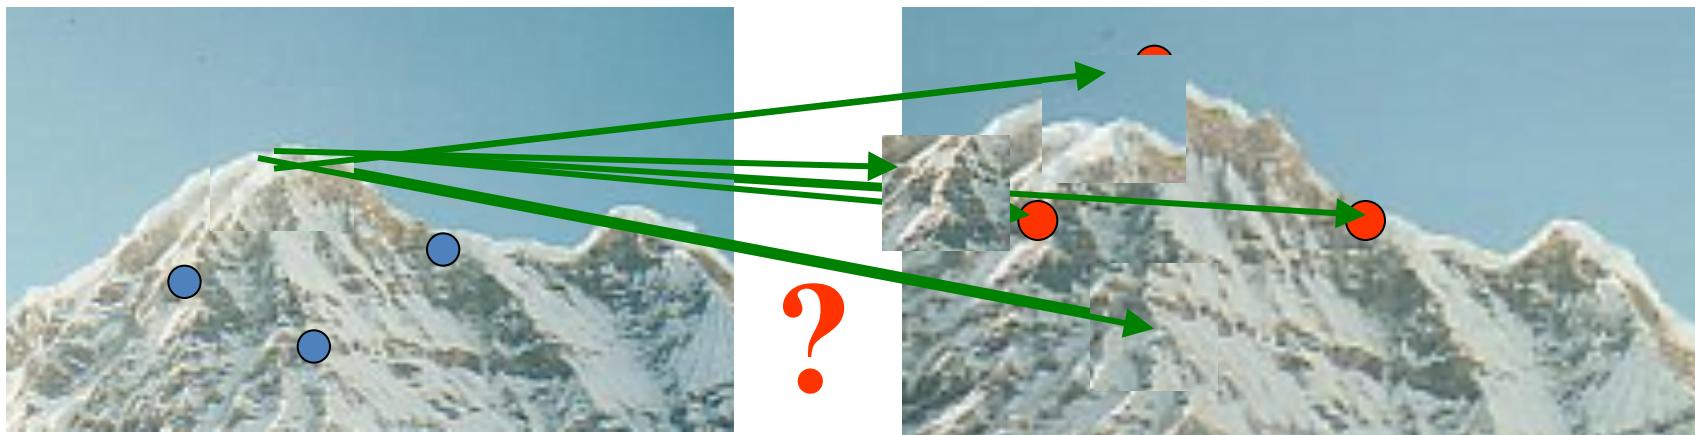

Goals for interest points

Detect points that are *repeatable* and *distinctive*

Goal for descriptors: distinctiveness

- We want to be able to reliably determine which point goes with which.

- Must provide some invariance to geometric and photometric differences between the two views.

Invariant Local Features

- Image content is transformed into local feature coordinates that are invariant to translation, rotation, scale, and other imaging parameters

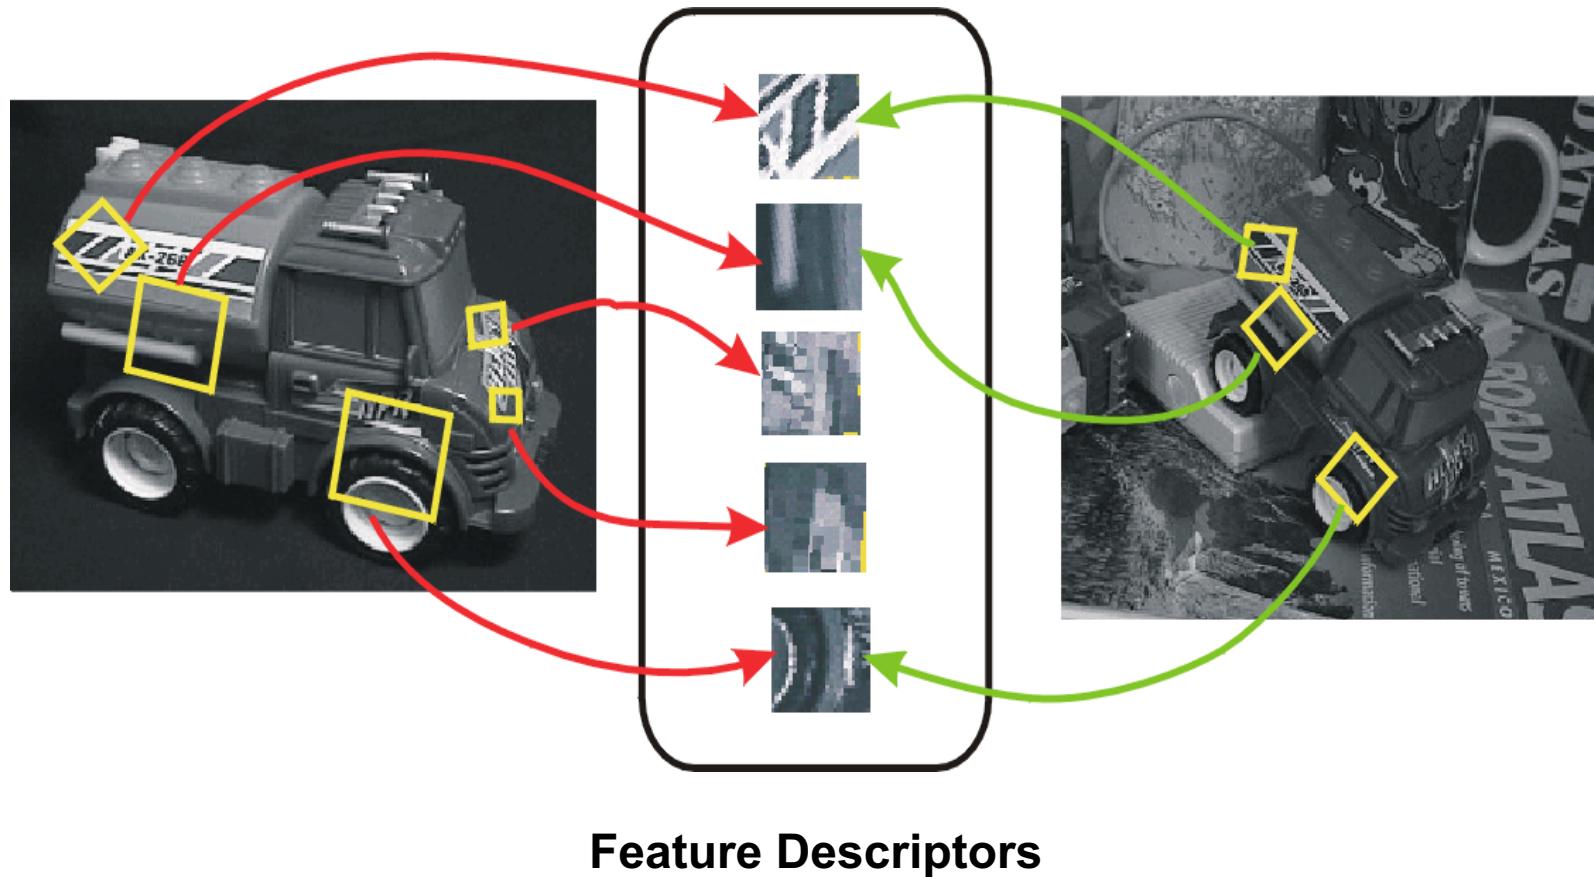

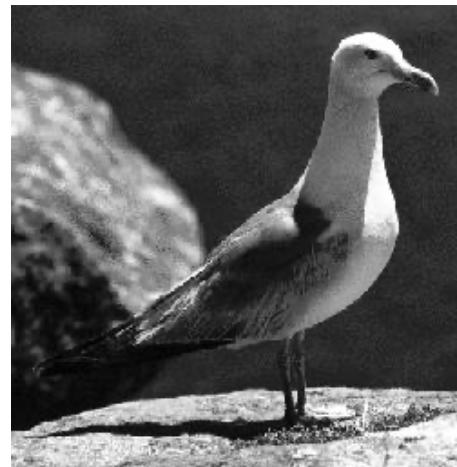

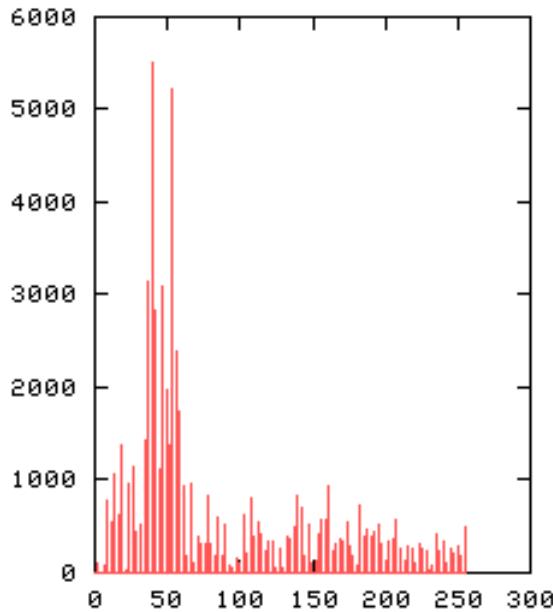

Image representations

- Templates
 - Intensity, gradients, etc.
- Histograms
 - Color, texture, SIFT descriptors, etc.

Image Representations: Histograms

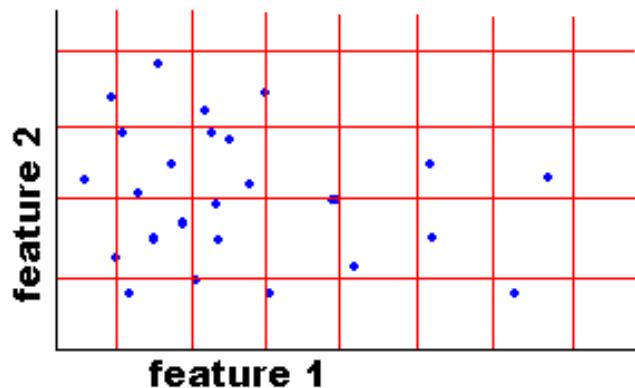

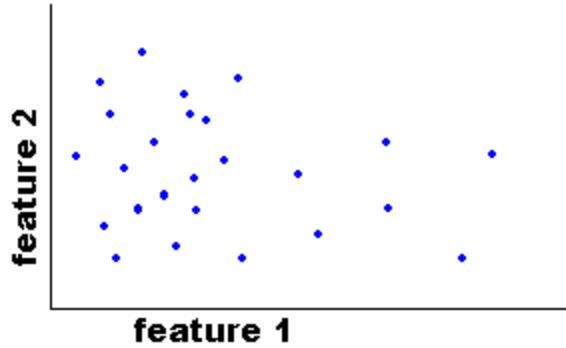

Global histogram

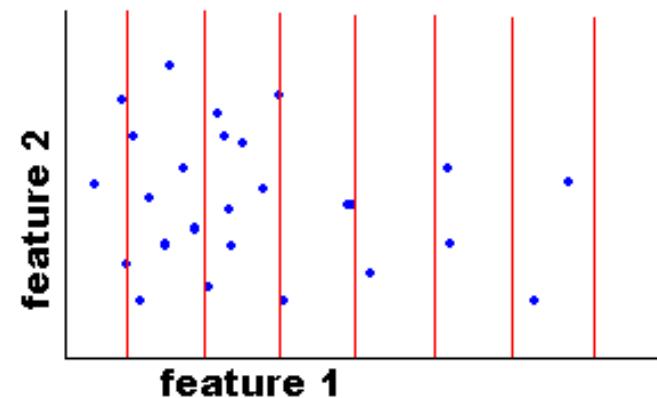

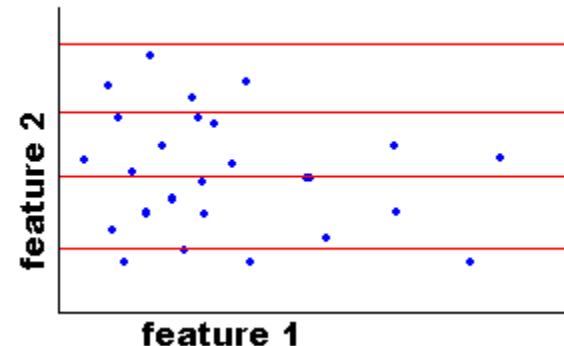

- Represent distribution of features
 - Color, texture, depth, ...

Image Representations: Histograms

Histogram: Probability or count of data in each bin

- Joint histogram
 - Requires lots of data
 - Loss of resolution to avoid empty bins

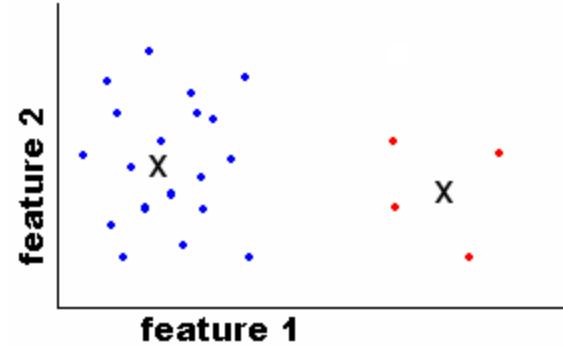

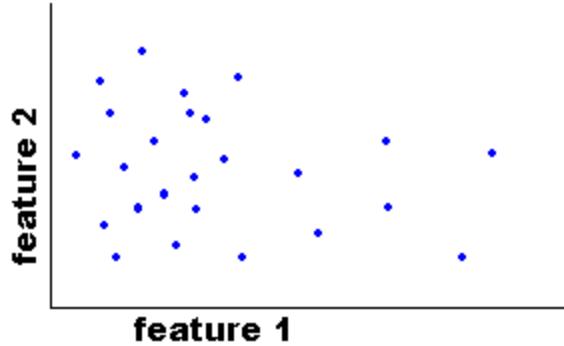

Marginal histogram

- Requires independent features
- More data/bin than joint histogram

Image Representations: Histograms

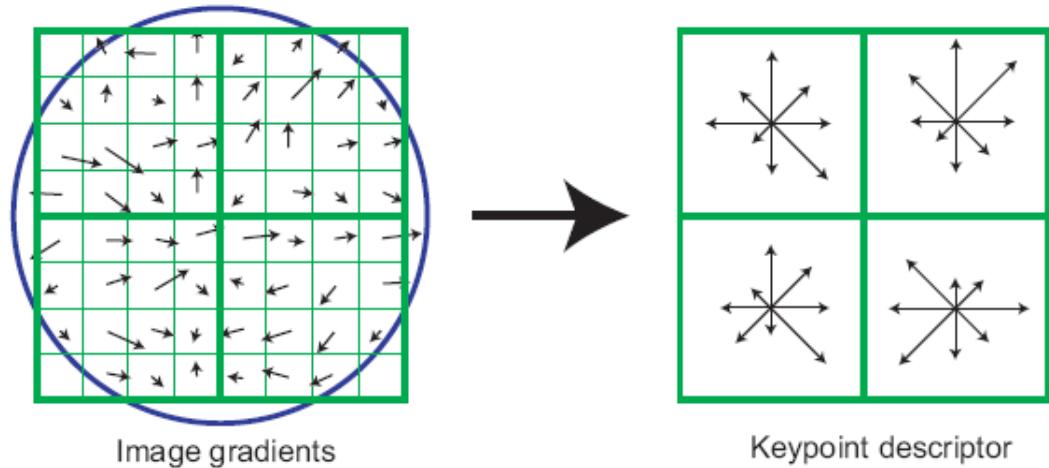

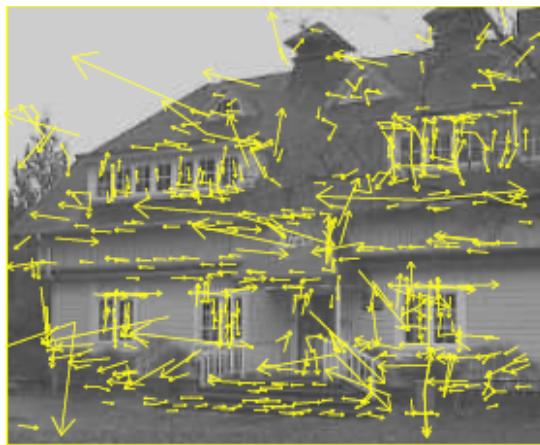

Clustering

Use the same cluster centers for all images

What kind of things do we compute histograms of?

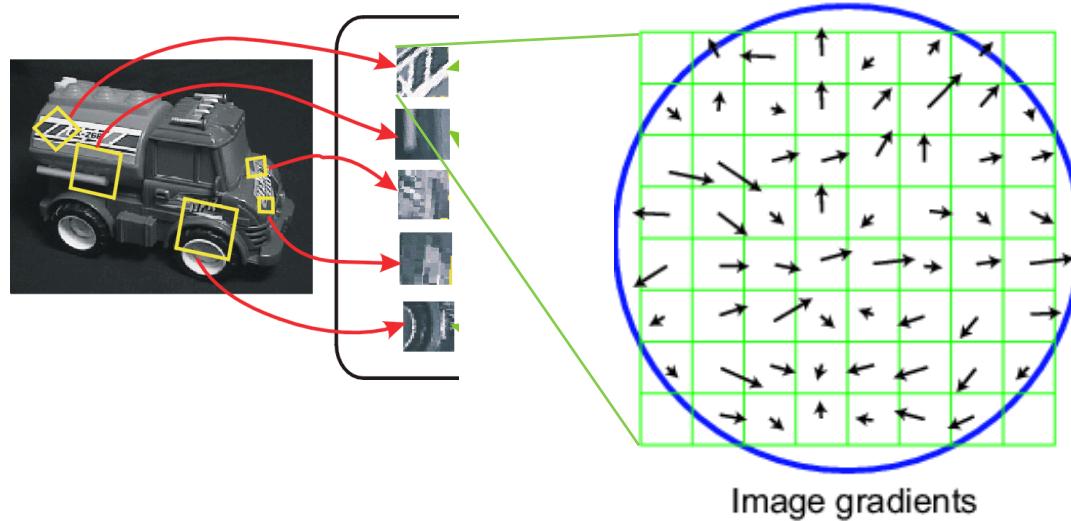

- Histograms of oriented gradients

SIFT – Lowe IJCV 2004

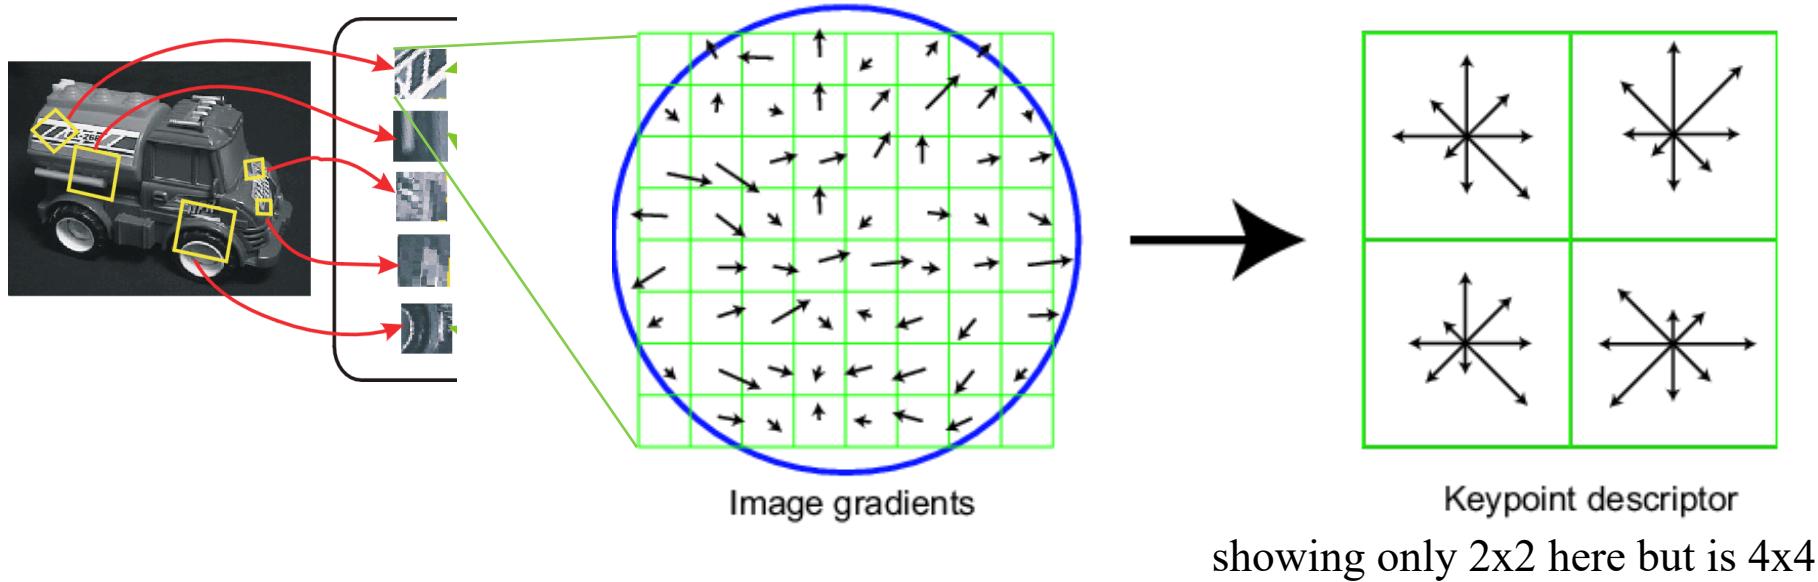

SIFT vector formation

- Computed on rotated and scaled version of window according to computed orientation & scale
 - resample the window
- Based on gradients weighted by a Gaussian of variance half the window (for smooth falloff)

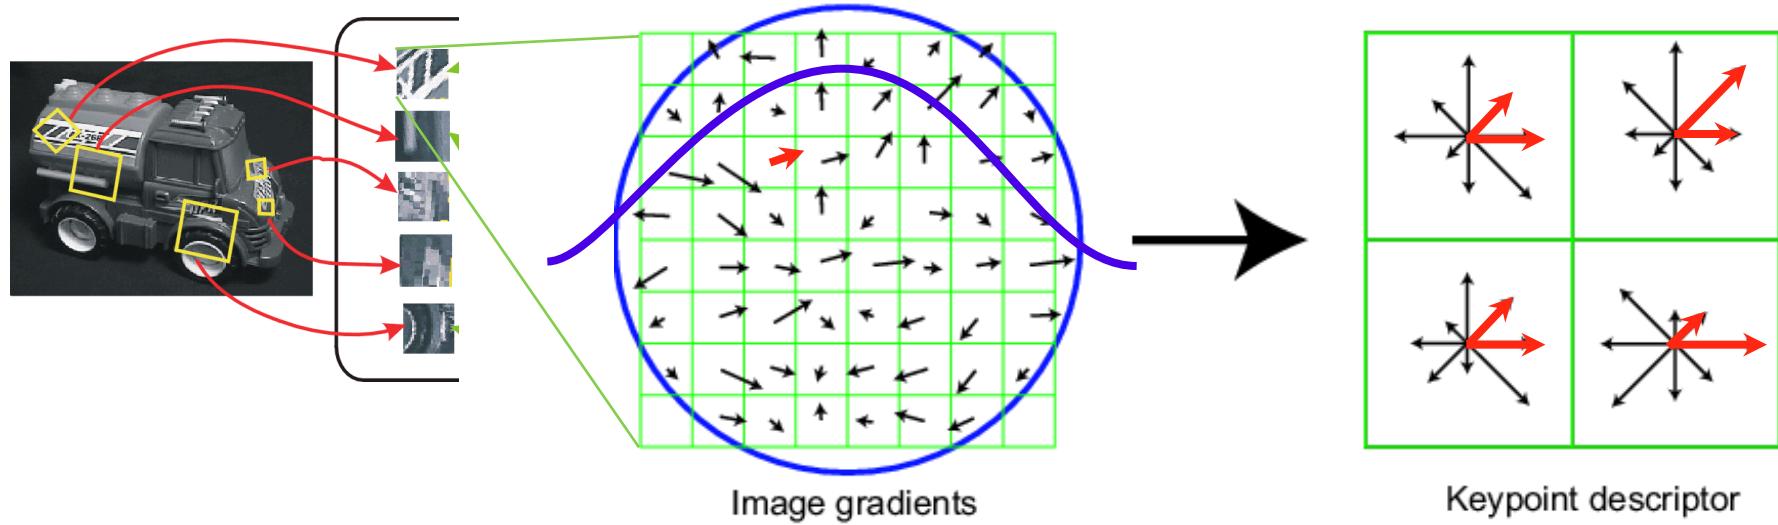

SIFT vector formation

- 4x4 array of gradient orientation histogram weighted by magnitude
- 8 orientations x 4x4 array = 128 dimensions
- Motivation: some sensitivity to spatial layout, but not too much.

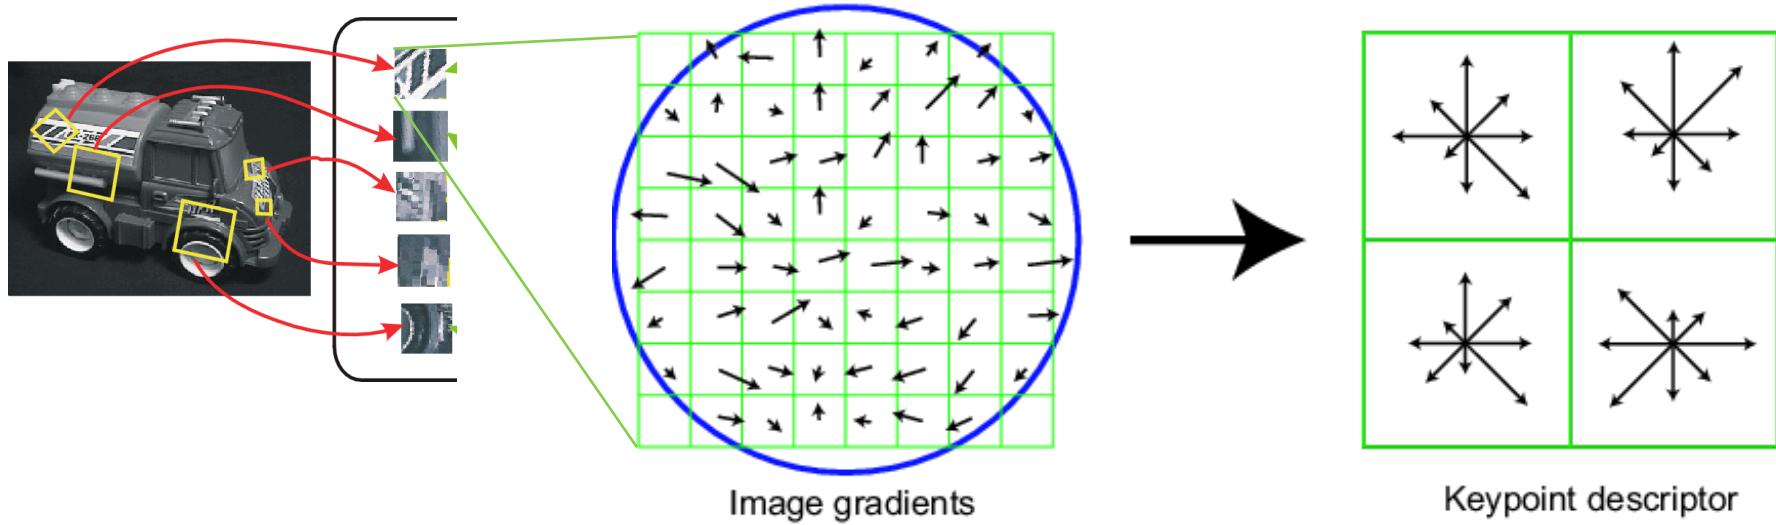

Ensure smoothness

- Gaussian weight
- Interpolation
 - a given gradient contributes to 8 bins:
4 in space times 2 in orientation

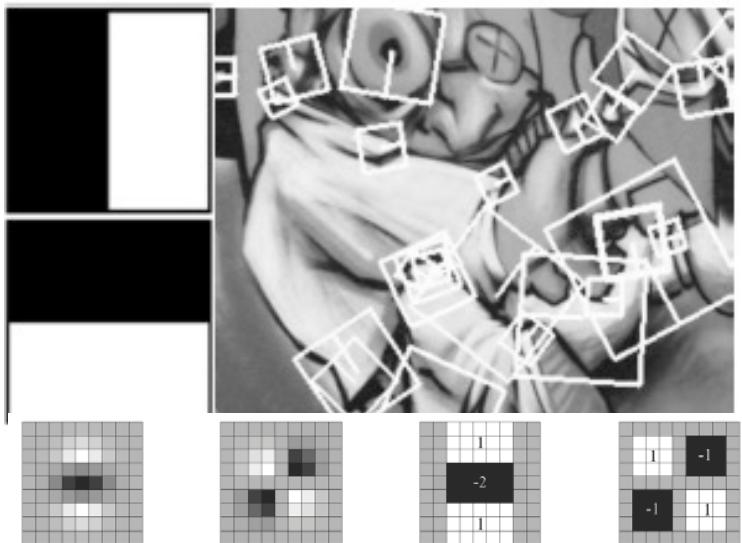

Reduce effect of illumination

- 128-dim vector normalized to 1
- Threshold gradient magnitudes to avoid excessive influence of high gradients
 - after normalization, clamp gradients >0.2
 - renormalize

Local Descriptors: SURF

Fast approximation of SIFT idea

Efficient computation by 2D box filters & integral images

⇒ 6 times faster than SIFT

Equivalent quality for object identification

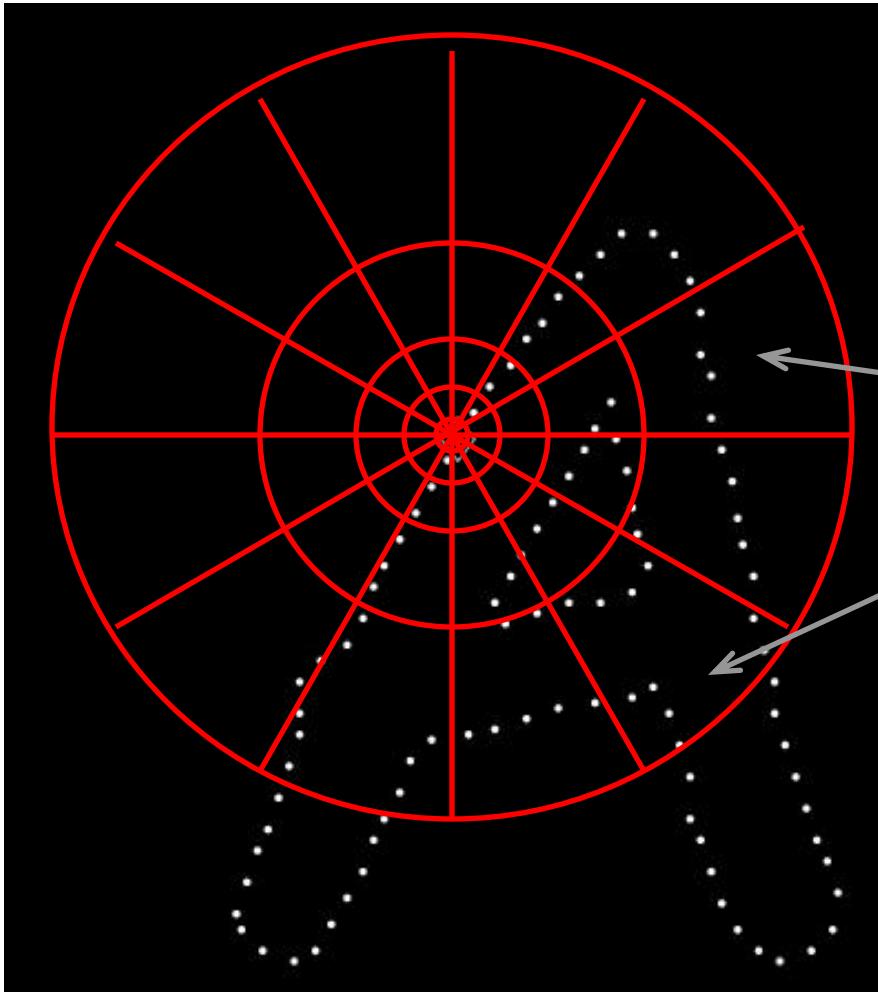

GPU implementation available

Feature extraction @ 200Hz

(detector + descriptor, 640×480 img)

<http://www.vision.ee.ethz.ch/~surf>

Local Descriptors: Shape Context

Count the number of points
inside each bin, e.g.:

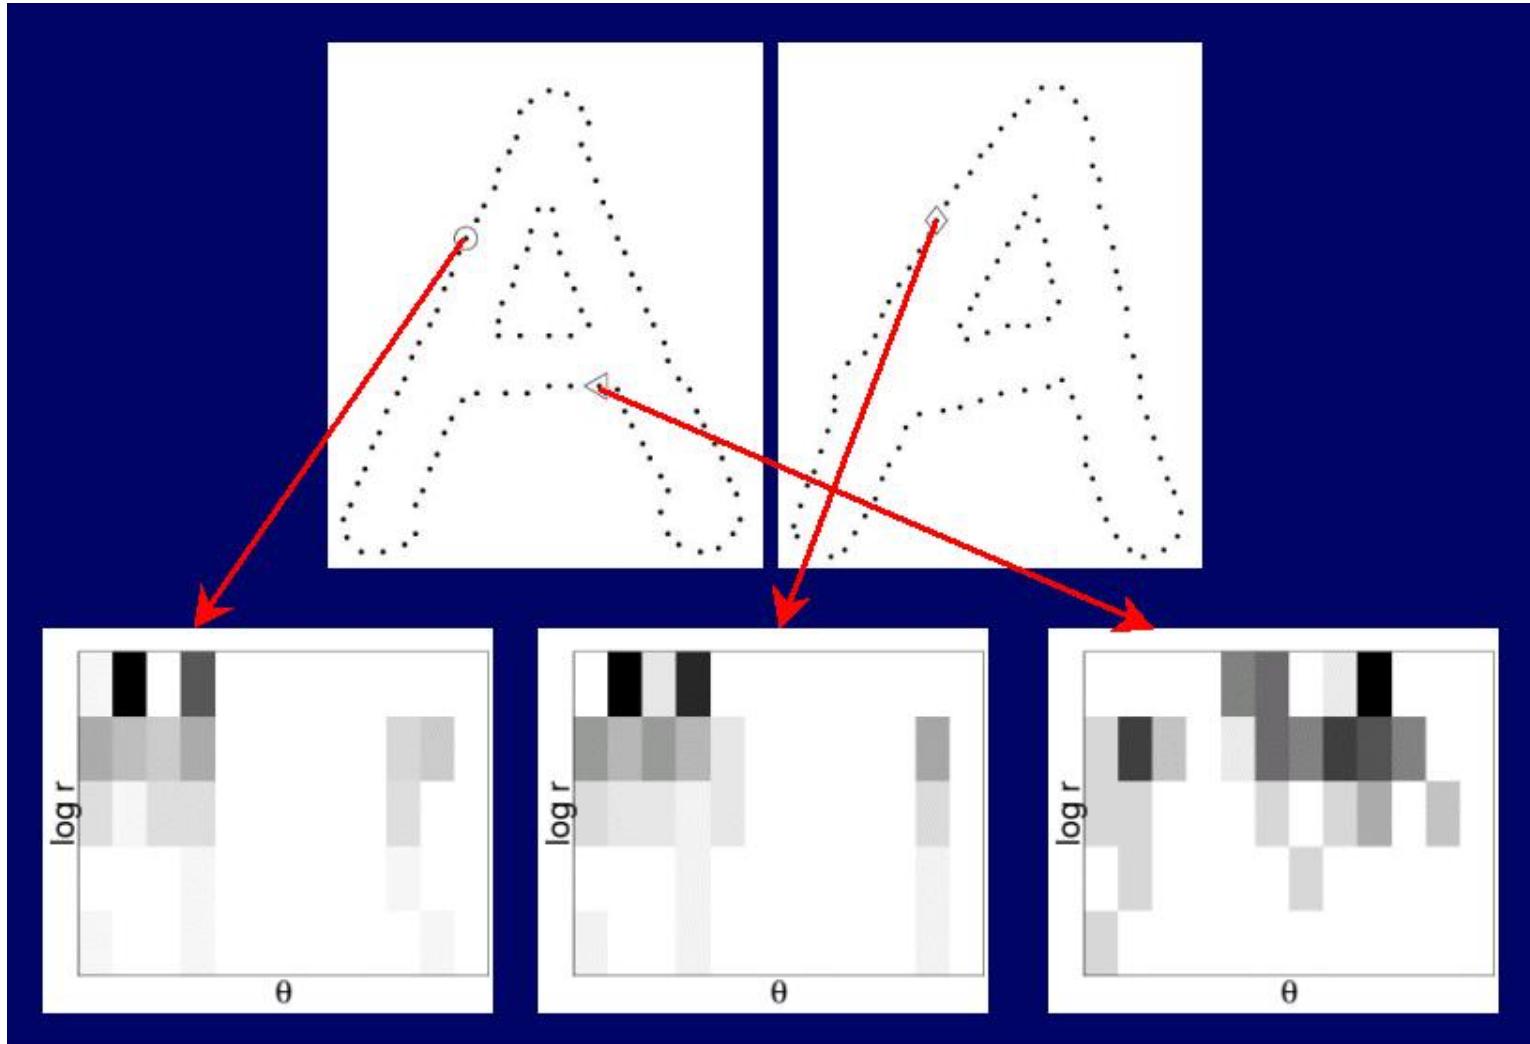

Count = 4

:

Count = 10

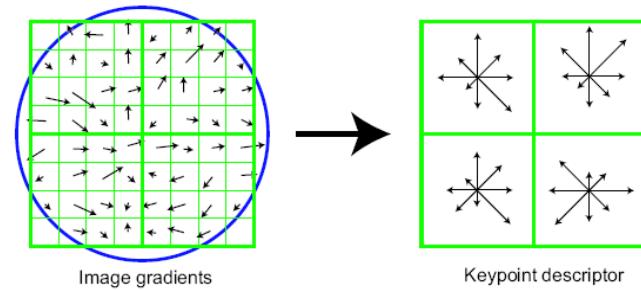

Log-polar binning: more precision for nearby points, more flexibility for farther points.

Shape Context Descriptor

Things to remember

- Keypoint detection: repeatable and distinctive
 - Corners, blobs, stable regions
 - Harris, DoG
- Descriptors: robust and selective
 - spatial histograms of orientation
 - SIFT

Deep Descriptors

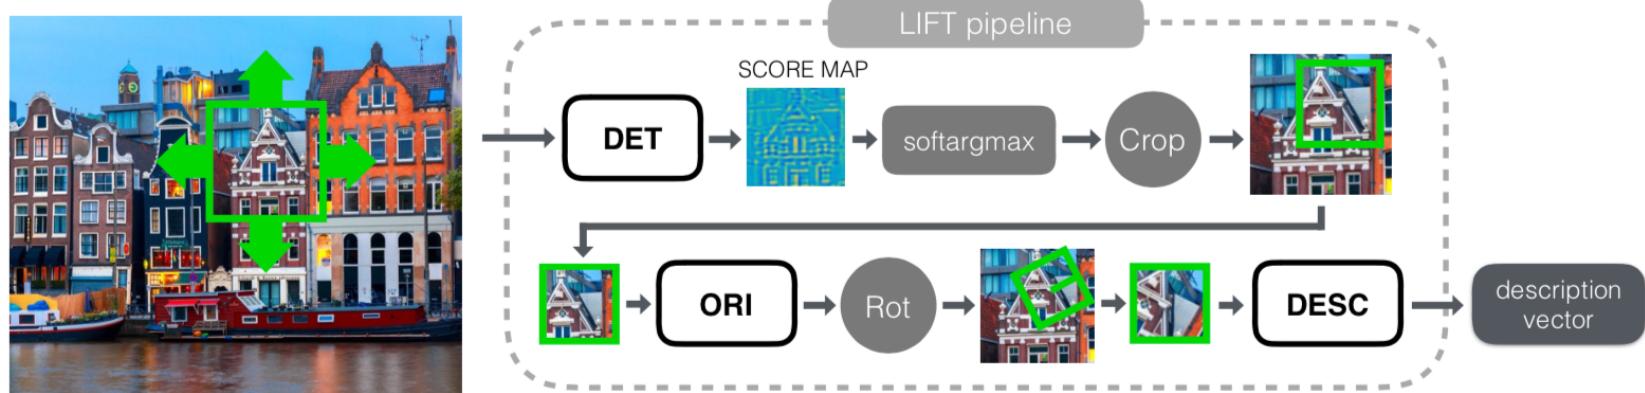

LIFT: Learned Invariant Feature Transform

ECCV 2016

Kwang Moo Yi^{*,1}, Eduard Trulls^{*,1}, Vincent Lepetit², Pascal Fua¹

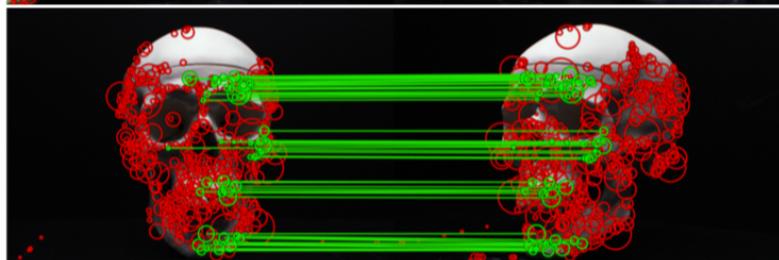

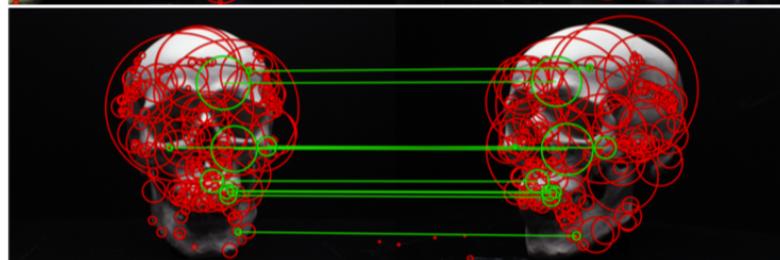

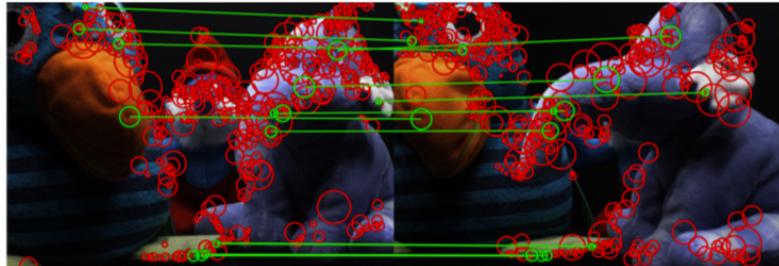

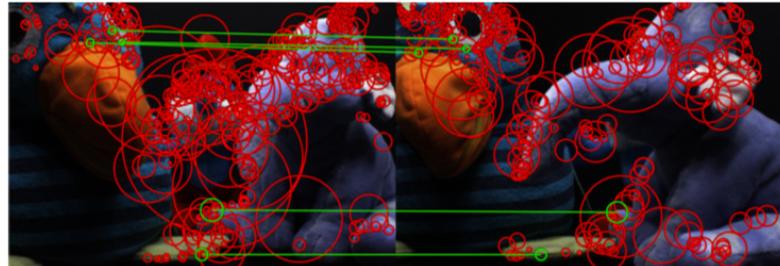

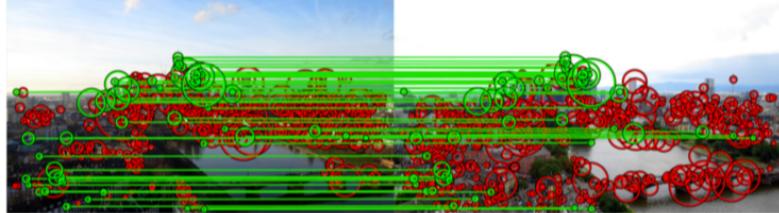

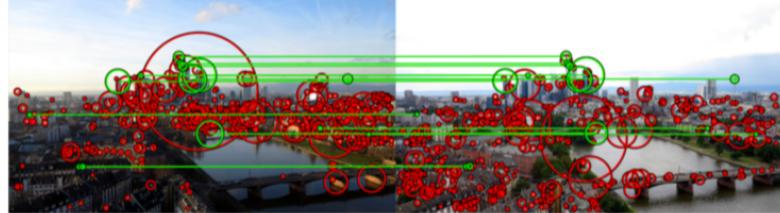

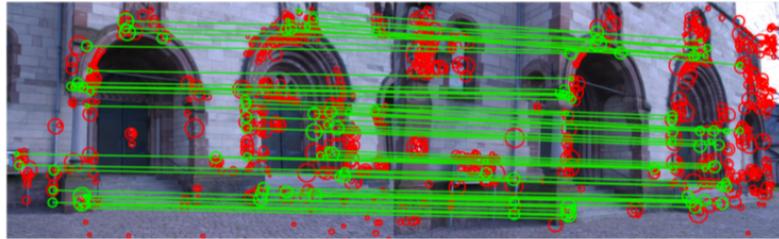

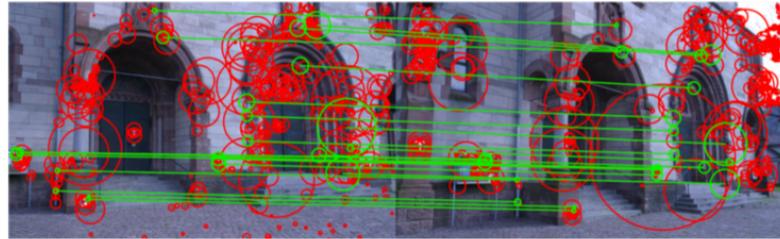

¹Computer Vision Laboratory, Ecole Polytechnique Fédérale de Lausanne (EPFL)

²Institute for Computer Graphics and Vision, Graz University of Technology

- Three networks: detection, orientation, description
- detection+orientation -> STN -> descriptor
- Trained separately :-)

SIFT vs. LIFT

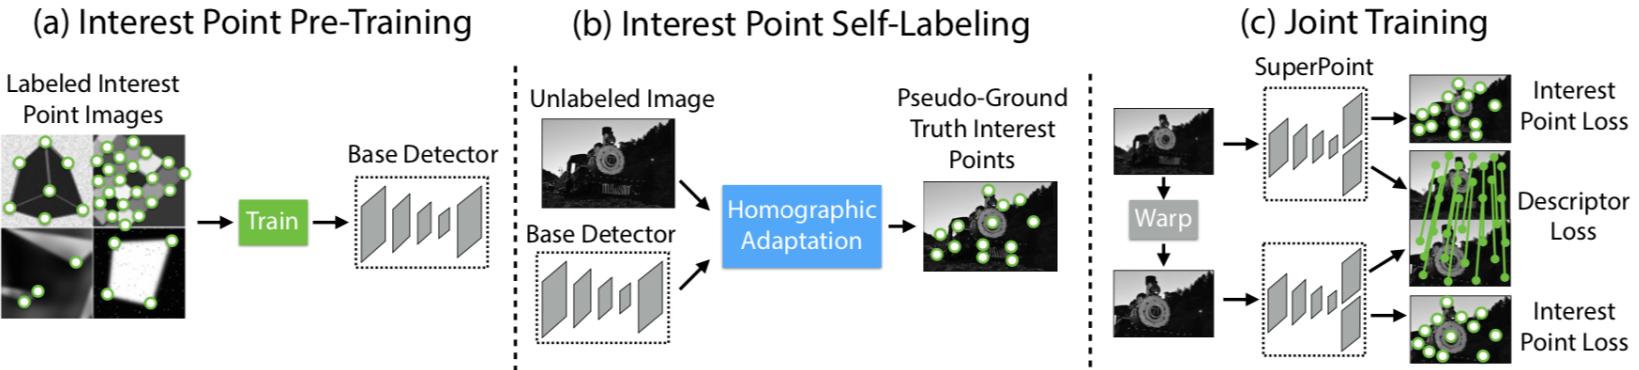

SuperPoint: Self-Supervised Interest Point Detection and Description

2018 CVPR Workshop

Daniel DeTone

SuperPoint Results

D2-Net: A Trainable CNN for *Joint Description and Detection* of Local Features

CVPR 2019

Mihai Dusmanu^{1,2,3}

Ignacio Rocco^{1,2}

Tomas Pajdla⁴

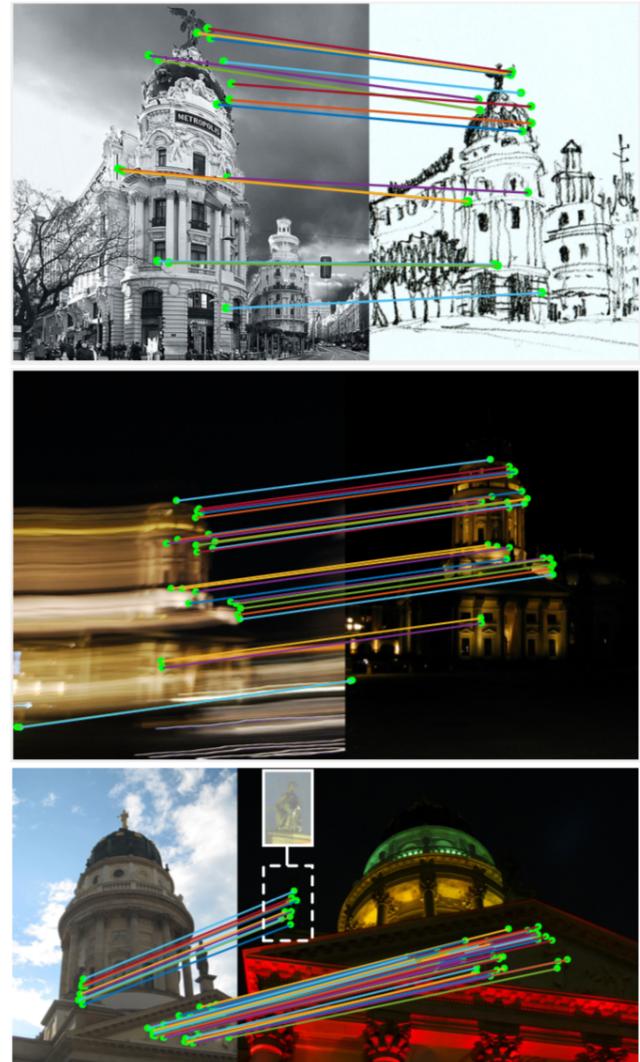

Marc Pollefeys^{3,5}

Josef Sivic^{1,2,4}

Akihiko Torii⁶

Torsten Sattler⁷

- Tensor viewed as descriptors and detector maps
- VGG16-based, loss encourages distinctiveness and repeatability
- Results beat the star of the art in day-night and indoor localization, but not in more traditional settings
(Superpoint shines for HPatches, **GeoDesc** for SfM)

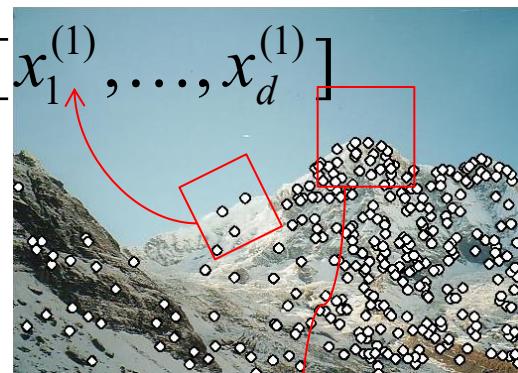

Matching

Local features: main components

1) Detection: Identify the interest points

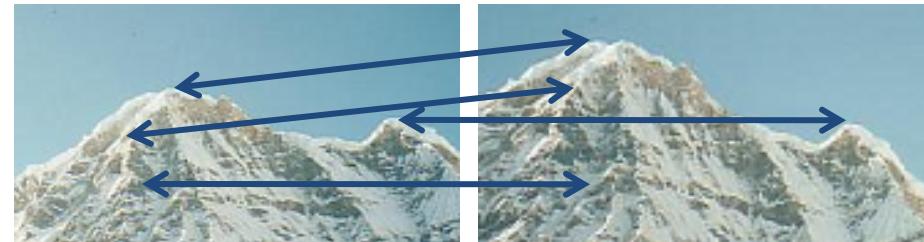

2) Description: Extract vector feature descriptor surrounding $\mathbf{x}_1 = [x_1^{(1)}, \dots, x_d^{(1)}]$ each interest point.

3) Matching: Determine correspondence between descriptors in two views

$$\mathbf{x}_2 = [x_1^{(2)}, \dots, x_d^{(2)}]$$

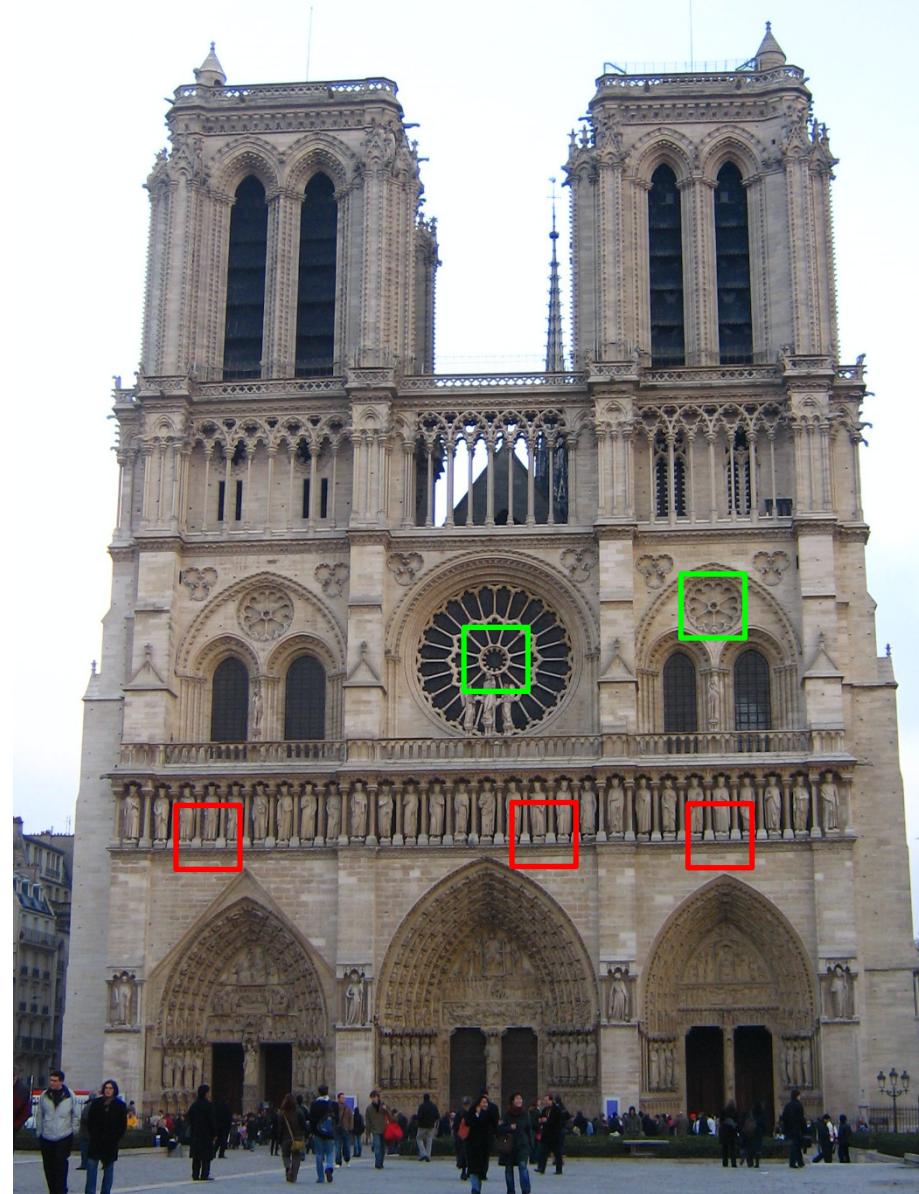

Matching

- Simplest approach: Pick the nearest neighbor.
Threshold on absolute distance
- Problem: Lots of self similarity in many photos

Distance: 0.34, 0.30, 0.40

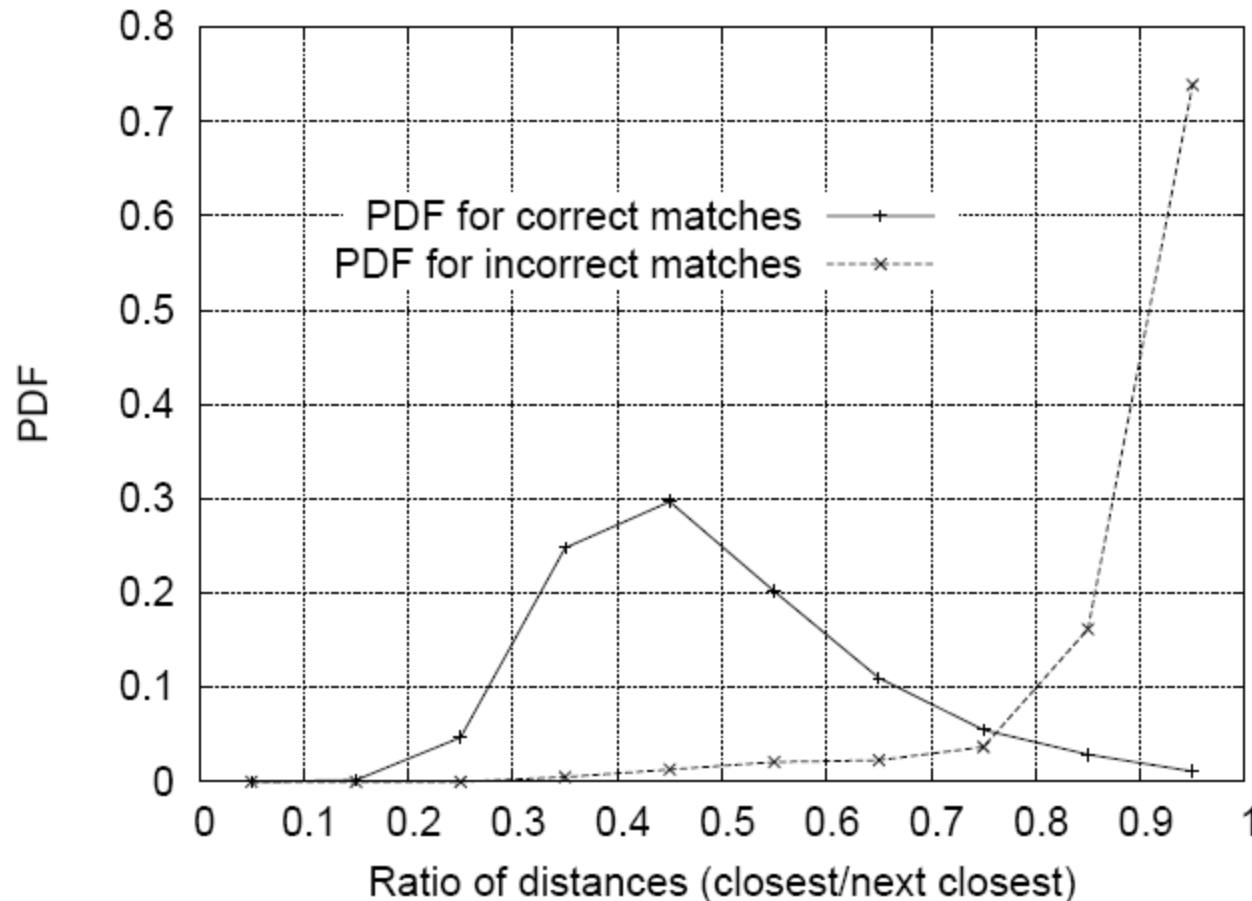

Distance: 0.61
Distance: 1.22

Nearest Neighbor Distance Ratio

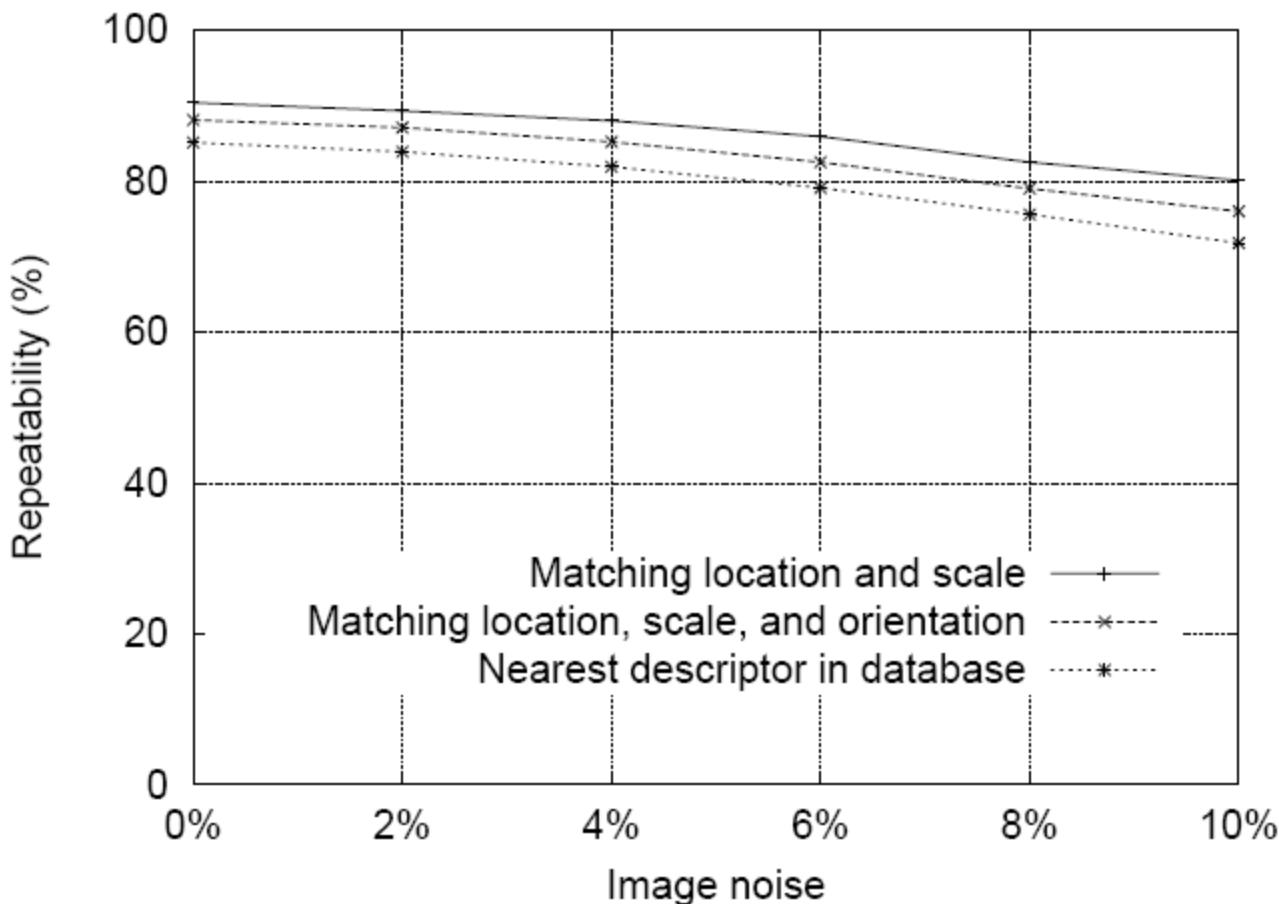

- $\frac{NN1}{NN2}$ where NN1 is the distance to the first nearest neighbor and NN2 is the distance to the second nearest neighbor.
- Sorting by this ratio puts matches in order of confidence.

Matching Local Features

- Nearest neighbor (Euclidean distance)
- Threshold ratio of nearest to 2nd nearest descriptor

SIFT Repeatability

SIFT Repeatability
